This invention describes novel synthetic antigenic peptides (A) based on the human chorionic gonadorropin (hofo beta subunit. These peptides have contraceptive properties and are used for the development of vaccines used to control fertility in ambals and to generate polyclonal antiesta for diagnostic use. The peptides are more specific immunogens than corresponding unmodified peptides are more specific. It et they do not elicit antibodies that cross-react with human lutelinished homone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; chortonic gonadotropin; hCG; three-dimensional; 3D; analogue; molecular simulation; visual display; chemical structure; growth factor;

Created) 101.NOV-1995 (Rel. 32, Last sequence update) 11.007-201 (Rel. 40, Last annocation update) Lutropin beta Chain precursor (Lutelnizing hormone beta subunit) (LSH-beta) (LSH-B) (LH-B) (Interstitial cell stimulating hormone).
                     bovies and porches speciess.

1. SHOWITION: PROMOTES SPERMANOGENESIS AND OWULATION BY STIMULATING
1. FUNCTION: PROMOTES SPERMANOGENESIS AND OWULATION BY STIMULATING
1. THE TESTES AND OVARIES TO STRATESIES SPERDIS.
1. SUBBUILT: HETRODIMES OF A COMMON ALPHA CHAIN AND A UNIQUE BETA
CHAIN WHICH CONFESS BIOLOGICAL SPECIFICITY TO THYROTROPIN.
1. STIMILARITY: BELONGS TO THE GLYCOPROPEIN HORMONES BETA CHAIN
FAMILY.

```
The invention relates to determining whether an analogue of human channed generating professional (30) structure as compared to hCG. Analogues of hCG and other glycoprotein common the second of the 
N-glycosylation site; follicle stimulating hormone; luteinising hormone; thyroid stimulating hormone; in vitro fertilisation; fertility; mutation; beta subunit; glycoprotein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Misc-difference 79
/note- "wild-type Val at this position can be mutated to Asn to introduce a new N-glycosylation site; see claim 3*
                                                                                                                                                                                                                                                                                                                                                                                                                       /note- "wild-type Phe at this position can be mutated to Asn to introduce a new N-giycosylation site; see claim 3"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Determining the 3-dimensional coordinates of chorionic gonadotrophin and computer-assisted re-design of the chemical structure - used for production of gonadotrophin hormone analogues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Grootenhuls PDJ, Harris DC, Isaacs NW, Lapthorn AJ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        26-JAN-1999.
```

The present invention describes an antigen (A) comprising a carrier chancially conjugated with a polypeptide (I) capable of elicting antibody response to human chorionic gonadotropin (GG) and not to human clustenising mornone (LH), or a polypeptide (II) capable of elicting antibody response to human GG. (A) has cytostatic, contraceptive, antibipartensive and antidoabetic activities and can be used as part of a vaccine. (A) has cytostatic, contraception, abortion and for treating hormone related diseases, for treating hormone proteins. (A) is useful for contraception, abortion associated carcinomas and to boost an animals resistance to exogenous proteins e.g. viral proteins. (A) is also useful in animal fertility control. for treating cancer, hypertension, diabetes and related vascular controls of seases (A), safely and effectively controls various disease states of maldies caused or influenced by unusual excesses of certain conjugation which does not have serious harmful side effects.

The present sequence represents the human CG beta subunit maino acid invention. Human, chorionic gonadotropin antigen; follicle stimulating hormone; cootraception, abortion; hormone related disease; carcinoma; cytostatic; contraceptive; antilifettility; antilypertensive; antidiabetic; vaccine; fertility; cancer; hypertension; diabetes. New antigen for treating hormone related diseases, is conjugated with a specific polypeptide which elicits an antibody response against human chorlonic gonadcropin. Human chorionic gonadotropin beta subunit amino acid sequence. Disclosure; Column 18; 61pp; English. as diagnostic tools to detect the presence of antibodies with respect to assay kits for assessing the biological samples, as control respents to assay kits for assessing the levels of these hormones in various samples, and in detecting and purifying receptors to which the native hormones bind: The single chain forms of the heterodimers or homodimers have the following advantages over their dimeric forms: they are more stable is needed to transcribe, translate and process, provide an alternate form truncated forms are unique starting asterism as reduing of activity levels and of in vivo half lives. Single chain forms are unique starting materials for identifying truncated forms with the protein to be engineerable for including of expensive the submutts permits the protein to be engineered without disturbing the overall folding of the protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; single chain gonadotropin analog; anti-infertility; drug;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequence represents the amino acid sequence of human chorionic gonadoropin (hCG) beta, amino acids 1-145. The protein is an important glycopictan hormone heterodimer, along with luteninsing hormone (LB), follicle stimulating hormone (FB), thyroid stimulating hormone (FB), which all have identical alpha subunits but differing beta subunits. The proteins are useful for generating antibodies specifically heterodiments from compounds, as substitutes for the heterodiments forms of the hormones, in the treatment of infertility, as add for in vivo fertilisation techniques, and in other therapeutic methods associated with the native hormones. The single chain proteins are further useful as reagents in a manner similar to the heterodimens,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; chorionic gonadotropin; hCG; glycoprotein hormone; infertility;

The sequence represents the beta-subunit of human chorionic gonadotrophin detacks. For the sequence represents the beta-subunit of human chorionic beta-sic have a disulfide bridged analogues of amino acid residues 38-57 of beta-sic have come a loop structure. The peptides are used in workines to raise to human pitutiary luterinising homone, to control the biological activity of endogenous RiCs. These antibodies may be used in disposite pregnancy tests and in detection of reduced fertility or infartility or infartility or infartility or infartility or infartility. They may also be administered for contracaption or abortion processes to human pitution to a foreign carrier, beptides can contracaption or abortion processes to humans to treat homon-associated carcinomas.
                                                                                                                                                                                                                                                                                                                                                                         Peptide analogues of beta-human chorionic gonadotrophin which are able to state antibodies against human chorionic gonadotrophin are used in vaccines as contraceptives and/or abortificants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human chorionic gonadotrophin; HCG; contraception; abortion; varoner related disorder; hormone-associated carcinoma; cancer; diabetes; vascular disease; 2011nger-Ellison syndrome; chronic digestive disorder; antigenic modification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   62 DVRFESIRLPGCPRGVNPVVSYAVALSCQCALCRRSTTDCGGPKDHPLTCDDPRFQDSSS 121

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                     The invention relates to human single chain forms of the glycoprotein common quartet which is an agonist or antagonist of intelainising hormone conformed quartet which is an agonist or antagonist of intelainising hormone (H), follicle stimulating hormone (CI), follicle stimulating hormone (CI), follicle stimulating hormone (CI), follicle stimulating hormone are betardiners baving identical alpha subunits and differing beta subunits. The agonist forms of single chain hormones are used in treating inferillity, as aids in vitro fertillisation techniques, and other thempeutic methods are useful a reaction of single chain hormones. The single chain hormones are useful associated with the native hormones in the single chain hormones are useful activities as control research in assay kits for assessing the levels of these hormones in various samples, and detecting and puritying creeptors to which the native hormones bind: The single chain hormones are last oused in affility chromatographic preparation of receptors or solution of subsequent preparations of these materials and to monitor invite of single chain hormones administered as puritication tools for isolution of subsequent preparations of these materials and to monitor invite of single chain hormones administered as puritication tools for isolution of subsequent to generate antibodies specifically immunoreactive with these new compounds, as substitutes for the heteroidment forms of hormones. The present sequence is human chorionic gonadotropin beta chain proteins are used to an assisting the control of subsidering the manage related to the invention Analog single chain proteins are used for constructing subjust described services as useful stritting compounds for template directed vector design and for the development of hormone specific vaccines for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human chorionic gonadotrophin beta-subunit. #GC; mammal; pregnancy test; human pitutiary luteinising hormone, redoced fertility; infertility; contraception; abortion; hormone-associated carcinoma.

The present sequence is given in a specification relating to the present polypeptides originally isolated from human early pregnancy utrine, now synthetically produced, as well as functional equivalents of these polypeptides. Novel beta-human chorionic gonadotrophin (hCG) fragments, designated Maternin (RTM) and referred to as MA and pMA peptides, are disclosed. Both native and synthetic MA Inhibited growth of human tumour cells inplanted into immuno deficient mice by between 60 to 100%. Faitave to control studies. The therapeutic MA polypeptides may be used for the prevention and treatment of a range of diseases and disorders, including human immunodeficiency virus (HTV) infections, disorders, including human immunodeficiency virus (HTV) infections, disorders (especially Raposi's sarcoma), wasting disorders, hemaniss, redistion mediated bone marrow damage and trauma related bload loss), inflammation and anglogenic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    2 SKEPLRPRCRPINATLAVEKEGCPVCITVNTTICAGYCPIMTRVLQGVLPALPQVVCNYR 61
                                                                                                                                                                                                                                                                                                                                                                                                        Cells that produce therapeutic beta-human chorionic gonadotrophin fragments, useful for the treatment of human immunodeficiency virus infections, cancers, wasting disorders, hematopolatic disorders, inflammation and anglogenic disorders

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ŏ
                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents the beta-subunit of human chorionic gondotrophin (#CG). The #CG beta subunit polypeptide sequence is considerably the disulfide bridge infants of the terminal cysteine amino acids of form a loop, and conjugated to acriter. The #CG antigenic peptides can be used in a vectime composition for prove/king an entitled bridge the beta of a carrier. The #CG antigenic peptides are useful for the purpose of contraception, abortion, completes are useful for the purpose of contraception, abortion, composition for the treatment of hormone-related disease states and to boost an and for the treatment of hormone-related disease states and consort and for the treatment of hormone-sacciated carcinomas, and to boost an conformation of the section of disease states and conformation of control disease, hypertension, collinger-Ellison syndrome, and chronic disease, hypertension, collinger-Ellison syndrome, and chronic disease, hypertension, collinger-Ellison syndrome, and chronic disease, hypertension, collinger-Ellison syndrome, and the control disease, hypertension, collinger-Ellison syndrome, and the chronic disease of the sundamental control disease of the convention of relatively large quantities of antitheolies for the non-endogenous materials in the body of the animals, and the consequent reduced risk of damage to the immune system, if exposed to the non-endogenous materials.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                             Novel vaccine composition for provoking the formation of antibodies to human chortonic gonadorropin, contains a peptide comprising disulfide bridges linking terminal cysteine residues to form a loop

The sequence is encoded by an analogue of MCG beta subunit cDNA contgrieve slear mutations which eliminate restriction sites, it was preputed from the plasmid pKMB inGC beta, a construct contgrieve hGC beta subunit isolated from human plasmid and Goodman) in plasmid pKMB, a derivative of pUCIB designed for facilitate clouing of glycoprotein hormones. The sequence as used as the starting construct for many mutants, (See AMRISOS)-RISI25 and AARISIGI-RISI9B).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The administration of a polypeptide determinant of a reproductive hormone such as human chorionic gondedropin (GG) can be used to produce non-immunogenic polyclonal antibodies (Ab) specific to that hormone. This process is useful for contraception, abortion and for treating hormone related disease states and disorders such as hormone-associated carcinomas. The polyclonal antibodies can also be used to boost an animals resistance to exogenous protein a side effects than the administration of steroids consisting of synthetic mon protein hormones, which were used conventionally.

The invention relates to the production of analogues of a heterodimeric subunit giycoporotain hormone (GR9), e.g. human chorionic gonadotropin (hCG), human intensialing hormone (RF8), human intensialing hormone (hL8), human follicie stimulating hormone (hCG), human intensialing hormone (hCG), human intensialing hormone (hCG), human chicked stimulating hormone, hormone (hCG), human chicked stimulating he handous retaining at least a portion of the charactivity for the corresponding native GPH receptor. This sequence constitutive for the corresponding native GPH seeptor. This sequence corresponding hormone, hormone, hormone, hormone, hormone, hormone, hormone, chereby creating greater likelihood that the discremit be formed in vivo and the formed dinner will have affinity for the native receptors and have segment activities of the hormones. The analogues can have uses as for the native GPHS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              62 DVRFESIRLPGCPRGVNPVVSYAVALSCQCALCRRSTTDCGGPKDHPLTCDDPRFQDSSS 121

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents human chorionic gonadotropin (CG). The invention is based upon the discovery that mutent the invention is based upon the discovery that mutent the full of the invention is based upon the discovery that mutent the man sproperotein hormone common alpha subunit (see ANYOSTAG).

CE and mutent human thyroid stimulating hormone (TSB) beta subunit (see ANYOSTAT), each comprising amino acid substitutions relative to the vild type sequences, can be produced and absembled to form mutent TSB heteroflame to sea mutent TSB heteroflame comprises the TSB beta in vitro and longer half life in vivo than wild-type heteroflamers.

CC in one embodiment, a mutent TSB heteroflame comprises the TSB beta subunit joined via a peptide bond at its C-terminus to the subunit joined via a peptide bond at its C-terminus to the subunit included methods of treating or preventing hypothryoidism, treating or disorder characterised by the presence of creating for a disorder characterised by the presence of creating for a disorder characterised by the presence of creating cor a disorder characterised by the presence of creating cor a disorder characterised by the presence of creating cor a disorder characterised by the presence of the TSB cheterodlamers can also be used for the targeted delivery of the repetition to the thyroid or to thyroid cancer cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Analogue; heterodimeric; glycoprotein hormone; hCG; hLH; hFSH; hTSH; hTSH; htman chorionic gonaddriopin; attainising hormone; alsulphide bond; human follicle stimulating hormone.

The present invention provides the sequences of several immunogenic epitopes and antibodies to human chorionic gonadotrophin (hGD). These can be used in the treatment of cancers where hGG synthesis occurs. Including badder, parereatic, certical, colorectal, iung, osesphageai, breast, pastric, prostete, oratio, uterine and endometrial cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cysteine knot protein; protein formation; heterodimeric protein analog; deglycosylated glycoprotein hormone; infertility; immunogen; antigen; polycystic ovarian disease; hGG; human; chorionic gonadotrophin; beta subunit; therapy; Jun.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Methods for producing heterodimers, particularly analogues of hormones,
                                                                                                                                         Human, antI-human chorionic gonadotropin (hCG) monoclonal antibody immunoreactive with a 2imer N-terminal fragment of C-terminal 37 subunits of hCG beta subunit, used to treat cancer along with vaccine comprising hCG groups
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              21 SKEPLRPRCRPINATLAVEKEGCPVCITVNTTICAGYCPTWTRVLQGVLPALPQVVCNYR 80

                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence comprises the human chorionic gonadotrophin (hCG) beta-submit. Fragments of the protein were used in the methods of the the function which involve the use of DNA vaccines encoding hCG antigens to induce an immune response and enable the treatment of cancer and provide a novel method of fertility control. In particular, they can be used to treat colorectal, breast and lung cancer, as hCG is associated with these types of tumours.
                                                                                                                                                                                                                                                                                                                                              Inducing immune response to human chorionic gonadotropin (bCG), useful for treatment of cancer and fertility control comprises exposing cells to nucleic acid construct encoding MCG immunogenic epitope -

This sequence is a fusion protein of RCC and Jun. The invention cleares to a method of forming a cysteine knote protein (1) having a lipha cleares to a method of forming a cysteine knote protein (1) having a lipha cleares to a method of forming a cysteine knote protein (10) having a lipha central conditions of the central of both subunits or the N-terminus of the central conditions and the conditions of the case of the C-terminus of the beta-subunit and dimerising the conditions of the central conditions and the conditions of such as the conditions of the conditions of such conditions of such conditions and industries that conditions conditions of the conditions of such conditions and industries that conditions of such conditions. The N-terminal part of a glycoprotein hormone may be committed in the conditions. Heterodimers have longer circulation times in vivo than individual subunits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cysteine knot protein; protein formation; heterodimeric protein analog; deglycosylated glycoprotein hormone; infertility; immunogen; antigen; polycystic ovarian disease; hCG; human; chorionic gonadotrophin; beta subunit; thorapy; Jun.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ð
                                                                                                           This sequence is a fusion protein of HGG and Jun. The invention clearlies to a method of forming a cystein knot protein (i) having alpha conclusions and beta-subunits comprising attaching a dimerisation domain (DD) to either the Witermini of both subunits or the Witerminia of the clearly attaching a dimerisation domain (DD) to either the Witerminia of both subunits or the Witerminia of the clearly produced the Certain of both subunits or the Witerminia of the clearly of the Certain of the C-terminia of the beta-subunit and dimerising the products to form a heterodimeric protein analog (II). The method is cused to produce analogues (agonists or antagonists) of deglycosylated glycoprotein homones, potentially useful, e.g. for treating infertility where caused by polycystic ovarian disease (associated with excessive cused to project or any polycystic ovarian disease, associated with excessive facilitates the formation of heterodimers, that have similar structures and allows the formation of heterodimers, that have similar structures and allows the combination of subunits that would otherwise combines, and allows the combination of subunits that would otherwise combines. Dependence and of subunitarial part of a dycoprotein hormone may be committed to subunitarial subunits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

This sequence represents a fusion protein of the human chorionic conductorphin (RGC) Deta subunit and Jun. The livention relates to a conductorphin (RGC) Deta subunit and Jun. The livention relates to a certain of forming a cysteine knot protein (1) having alpha and the method of forming a cysteine knot protein (1) having alpha and the method of forming a cysteine knot protein (1) having alpha and the relation of the latenthian of the alpha-subunit and the relation domain (DD) to either the N-ternainus of the alpha-subunit and the relation of the alpha-subunit and to the N-ternainus of the alpha-subunit and hardward of a heterodimeric protein analog (11). The method is used to produce nationally specially useful, e.g. for treating infertility where caused by polycystic ovarian disease (associated with excessive levels of interliating hormone). Products that retain DD's are also useful as intentiating and immunogenic or properties) to native dimers, and allows the formation of heterodimers, that have similar structures can allows the combination of subunits that would otherwise combines.

Comparison of a subunitar that would otherwise combines and condition without loss of activity, and attachment of the DD reduces the formation of homodimers here of the Dreduces in this relation times in the view in individual subunits.
                                                                                                                                                                                                                                                                                                                  Methods for producing heterodimers, particularly analogues of hormones, from subunits of cysteine knot proteins -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cysteine knot protein; protein formation; heterodimeric protein analog; deglycosylated glycoprotein hormone; infertility; immunogen; antigen; polycystic ovarian disease; hCG; human; chorionic gonadotrophin; beta subunit; therapy; Jun.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      118 DVRFESIRLPGCPRGVNPVVSYAVALSCQCALCRRSTTDCGGPKDHPLTCDDPRFQDSSS 187

                                                                                                                                                                                                                                                                                                                                                                            This sequence is a fusion protein of HGG and Jun. The invention cleares to a method of forming a cysteine knot protein (i) having alpha and beta-subunits comprising a testeine knot protein (ii) having alpha and beta-subunits comprising attaching a dimerisation domain (DD) to either the N-termino of both subunits or the N-terminos of the capture of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                              Methods for producing heterodimers, particularly analogues of hormones, from subunits of cysteine knot proteins -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cysteine knot protein; protein formation; heterodimeric protein analog; deglycostated glycoprotein hormone; infertility; immunogen; antigen; polycystic ovarian disease; hCG; human; chorionic gonadotrophin; beta subunit; therapy; Jun.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0; Gaps

The sequence represents the amino acid sequence of single chain goodcropin analogue 11. The giveportein homomone analogue 13. The giveportein homomone and the homomone of the homomone. The single chain protein is did for in vivo fertilisation techniques, and in other therapeutic methods associated with the native horanone. The single chain protein is further useful as a reagent in a manner similar to the heterodimer, as a diagnostic tool to detect the presence of annibodies with respect to the native proteins in the presence of annibodies with respect to the native proteins in the commons in various samples, and in detecting and the level of the samples, as control reagent in assay kits for assessing the levels of these horanones him various samples, and in detecting and the corn soft the heterodimers or homodimers have the following advantages over their dimeric forms: they are more stable, problems of recombinant control of the process, provide an alternate form thus permitting fine training of activity levels and of in vivo half lives. Single chain forms are unique starting materials for indentifying remoter forms. The linkage between the submits permits the process are provided an alternate form thus permitting the control of the process. Provide an alternate form thus permitting the control of the dimer. The linkage between the submits permits the

                                                                                                                                                                                                                                                                                                                                                                                 This sequence is a fusion protein of HGG and Jun. The invention accelerates to a method of forming a cysteine knot protein (i) having a pipul and relates to a method of forming a cysteine knot protein (ii) having a pipul and beta-subunits comprising attaching a dimerisation domain (DD) to either the N-termina of both subunits or the N-termina of the capture of the capture of the characteristic or the N-termina of the beta-subunit and dimerising the products to form a heterodimeric protein analog (II). The method is compared to produce analogues (sponists or anagonists) of delyroxylated sused to produce analogues (sponists or anagonists) of delyroxylated sused to produce analogues (sponists or anagonists) of delyroxylated sused to provide forminally useful. 6.9 for treating infertility where caused by polycystic ovarian disease (associated with excessive compared to an inference of subunits of the total continuing highly antigents and mannogens or antigens (since a DD may contoining highly antigens of another formation of heterodimers, that have similar structures and allows the combination of subunits that vould otherwise combines, and allows the combination of subunits that vould otherwise combines.

Condition and an analogue of subunits that vould otherwise combines, be modified without loss of activity, and attachment of the DD reduces to vivo than individual subunits.
                                                                                                                                                                                                                                                                             Methods for producing heterodimers, particularly analogues of hormones, from subunits of cysteine knot proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   21 SKEPLRPRCRPINATLAVEKEGCPVCITVNTTICAGYCPTMTRVLQGVLPALPQVVCNYR 80

The invention relates to human single chain forms of the glycoprotein formone duranter which is an agonist or antegonist of luteinising hormone [LB], follicle stimulating hormone [FB], thyroid stimulating hormone [FB], thyroid stimulating hormone [FB], thyroid stimulating hormone [FB], thyroid stimulating hormone having identical alpha subunits and differing beta subunits. The agonist forms of single chain hormones are used in treating infertility, as aids an sociated with the native hormones, and other therspect in embrods associated with the native hormones. The single chain hormones are useful detect the presence of antibodies with respect to the native proteins in biological samples, as control reagents in assay kits for assessing the
                                                                                                                                                                                                                                                                                                                                                                                                                   Location/Qualifiers

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence represents the amino acid sequence of single chain gondadotropin analogue #18.

Gondadotropin analogue #18.

The jycopotedin hormone analogue #18.

Consecut for generating antibodies specifically immunoreactive with new compounds, as a substitute for the heterodiment of the monones, in the treatment of infertility, as an aid for in vivo fertilisation techniques, and in other therapeutic methods associated with the native hormone. The single chain protein is further useful as a reagent in a manner similar to the heterodimen, as a diagnostic tool to detect the commone. The single chain protein is further useful as a reagent in a manner similar to the heterodimen, as a diagnostic tool to detect the composition of antibodies with respect to the native proteins in the bounds of antibodies with respect to the native proteins in the conjugates hormones in various samples, and in detecting and proteins of the native hormones bind. The single chain forms the manner of the heterodimers or homodimers have the following adventages over their dimetic forms: they as final gene is needed to transactible, translate and process, provide an afternate form thus permitting fine tuning of activity levels and of in "vivo half lives. Single chain forms care unique starting materials for identifying truncated forms with the catcular and process, provide an afternate form thus permitting the catcular of the dimer. The linkage between the subunits permits the protein to be engineered without disturbing the overall folding of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New single chain forms of the glycoprotein hormone quartet useful for generating antibodies specifically immunoreactive with the new compounds, in treating infertility, or as aids for in vivo fertilization techniques.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              62 DVRFESIRLPGCPRGVNPVVSYAVALSCQCALCRRSTTDCGGPRDHPLTCDDPRF0DSSS 121

The invention relates to human single chain forms of the glycoprotein common quarter which is an agoniato a managonist of intensinising hormone componence (HJ), follicle stimulating hormone (FSH), thyroid stimulating hormone (HJ), follicle stimulating hormone (HJ), follicle stimulating hormone (FSH), thyroid stimulating hormone (HJ), follicle stimulating hormone (FSH), thyroid stimulating hormone (HJ), follicle stimulating submitts and differing beta submitts. The agoniat corresponds of single chain hormones are used in teating infertility, as aids in vitro fertilisation techniques, and other therapeutic methods associated with the native hormones are useful associated with the native hormones are useful associated with the native hormones, are disaponated to biological samples, as control research in associated the presence of antibodies with respect to the native proteins to biological samples, as control research in associated than mornones are useful selecting and purifying creeptors to which the native hormones blud. The single chain moments can be also used in affairty chromatographic preparation of receptors or cathonone antibodies. They are used as purification tools for isolation of subsequent preparations of these materials and to monitor isolation of subsequent preparations of these materials and to monitor of the preparation of single chain hormones administered as afungs. The single chain glycoproteins are used to generate antibodies specifically immunoractive (consisting of human single chain gonadorropin and of not a related to the invention. Analog no.1a is a fusson protein and companied to the invention and and on the analog serves as a useful starting compound for template directed vaccine design and for the development of hormone-specific vaccines for use in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New DNA or RNA encoding single chain protein useful in treating infertility, as aids in vitro fertilization techniques, or other infertile methods associated with the native hormones
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match 99.1%; Score 770; DB 22;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
levels of these hormones in various samples, in detecting and purifying receptors to which the native hormones bind: The single chain hormones con are also used in affinity chromatographic preparation of receptors or antihomane santibodies. They are used as purification tools for continuous of subsequent preparations of these materials and to monitor of sobsequent preparations of these materials and to monitor of scoprofusias are used to generate antibodies specifically immunoraative vith these me compounds, as substitutes for the heterodimeric forms of hormones. The present sequence is human single chain oncil as fusion protein consisting of human choicate chain gonadotropin (c5) beta subunit (1-145 amino acids) cof human single chain gonadotropin along the consisting of human single chain gonadotropin subunit (1-162 amino acids) by a linker sequence. This analog serves as a useful starting compound specific vaccines for use in humans.

This sequence is a fusion protein of HCC and Jun. The invention claims acqueated to forming a cysteine knot protein (i) having alpha calcless to a method of forming a cysteine knot brotein (ii) having alpha and beta-subunits comprising attaching a dimerisation domain (DD) to either the Nitermini of both subunits or the Niterminia of the calching a dimerisation domain (DD) to either the Niterminia of both subunits or the Niterminia of the Calchina of the calchina of the Calchina of the Cartains of the calchina of the combination of heterodimers, that have shall are thereful and allows the combination of subunits that would otherwise combine of and allows the combination of subunits that would otherwise complice to poorly, or not at all. The Niterminal part of a glycoprotein hormone may be modified without loss of activity, and attachment of the DD reduces to constitute the bound of the Combination of subunits.
                                                                                                                                                             Cysteine knot protein; protein formation; heterodimeric protein analog; deglycosylated glycoprotein hormone; infertility; immunogen; antigen; polycystic ovarian disease; hGG; human; chorionic gonadotrophin; beta subunit; therapy; Jun.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Methods for producing heterodimers, particularly analogues of hormones, from subunits of cysteine knot proteins -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             189 DVRFESIRLPGCPRCVNPVVSYAVALSCQCALCRRSTTDCGGPKDHPLTCDDPREQDSS 248

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence is a fusion protein of hos and Jun. The invention calcletes to a method of forming a cysteine knot protein (1) having alpha calcletes to a method of forming a cysteine knot protein (1) having alpha and beta-subunits comprising attaching a dimerisation domain (0D) to either the N-termino of the subunits or the N-terminos of the calclete the calclete the Compression of the calculations of the beta-subunit and to dimerising the products to form a heterodimeric protein namelog (II). The method is used to produce analogues (sponists or antegonists) of deglycopylated superior caused by polycystic ovarian disease (associated with excessive calcletes) or intentialing hormone). Products that retain but with excessive calculates or antiques (since a Do may containing highly antiquence) facilitates the formation of heterodimers, that have similar structures and allows the combination of subunitar that would otherwise combines, and allows the combination of subunits that would otherwise combines. Dependence of subunits that would otherwise combines and of subunitarial that would otherwise combines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents the beta subunit of human chorionic gonadotropin which is used in a method for the treatment or prevention of disease, by increasing production of at least one type of hamatopoletic cell. A method is also described in which non-terminally differentiated hamatopoletic cells are treated in which non-terminally differentiated hamanoceliciency will a KIV) infection, diopathic thrombocycopania purpure, anamala or neutropaenia, or subjects who have undergone chemotherapy or radiation retained. Nor seperably it can be used to there a wide range of conditions involving hamanocpoletic failure, (non-hamatopoletic tumours, autoimmune disease and genetic disorders (using a hransformed hamanocpoletic cell), the in vitro method can also be used to expand hamanocpoletic cell; the in vitro method can also be used to expand hamanopoletic cells for subsequent therapeutic use.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The invention relates to the production of analogues of a heterodimeric subulit giycoprotein hormone (GPH) a.9, human chorionic gonadotrophin (CC (hCG), human lutefalsing hormone (HEM), human follicle stimulating hormone (HEM), human follicle stimulating hormone (HEM), human follicle stimulating connected to concern the second that the stimulating hormone (HEM), and interioral connected an intersubunit disulphide bond, between an alpha-subunit cystelie and a beta-subulit cystelie, for contain an intersubunit disulphide bond, control in proved stability, the analogue retaining at least a portion of the laproved stability for the corresponding native GPH receptor. This sequence constructive for the corresponding native GPH receptor. This sequence corresponding presents the vill cycle hCG-beta subunit used for the generation of the corresponding present likelihood that the dumer will be formed in vivo and the formed dimer vill here affinity for the native receptors and have considered and cutivities of the hormones. The analogues can have uses
                                                                                                                                           Analogue; heterodimeric; glycoprotein hormone; hCG; hLH; hFSH; hTSH; human chorionic gonadotrophis human iluteinisting hormone; disulphide bond; human follicle stimulating hormone; human thyroid stimulating hormone; stability; primer; amplification; PCR; mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          62 DVRFESIRLEGCPRGVNPVVSYAVALSCQCALCRSTTCCGGFKDHPLTCDDPRPQDSSS 121

The invention provides movel vaccine compositions which comprise the beta-subunit of human chorionic gonadotropin (betahcfojin combination beta-subunit of human chorionic gonadotropin (betahcfojin combination bitch chicksan-based adjuvants. The vaccines are used to induce a monitorial production. The vaccines compositions are also used for antibody production. The vaccines comprise a well-tolerated chicksan-based adjuvant which induces the production of anti-chorionic gonadotropin antibodies, without inducing the side effects (e.g. hypersensitivity, erpthems, etc.) associated with other adjuvants. The vaccine also overcomes the problem of non-responsiveness in some individuals. The present sequence respersents a betahcg/beta-gal fusion protein consisting of leaderless betahcG linked to a beta-gal fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel human beta-subunit chorionic gonadotropin vaccines used to integrupe fertility in mammals by the immunological inactivation of the pregnancy hormone chorionic gonadotropin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to the production of analogues of a heterodimeric subunit glycoporotein hormone (GH9), and man inteinish promone (GH9), human inteinish operation (GH9), human inteinishing hormone (H99), human inteinishing hormone (H99), human inteinishing mormone (H99), and inteinialing contents, which are modified to contain an intersubunit disuphide bond, between an alpha-subunit cysteine and a beta-subunit opsteine, for improved stability, the analogue retaining at least a portion of the blancous stability, the analogue retaining at least a portion of the corresponding native GHP receptor. This sequence content and an antared MGC-beta subplit used for the generation of the modified GH9s. The improved analogues are designed specifically to theoreoperturbation of the 3-dimensional structure of the hormon, thereby creating greater likelihood that the dimer will be formed in vivo and the formed dimer will have affinity for the native receptors and have agont stabilise the GH9s and prolong as for the native GH9s.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ;
